Custom Mix Options

Scotts are pleased to offer or recommend factory additions and variants to our compost formulations to maximise convenience and performance according to grower needs and preferences. These include the following:

Technically advanced **Osmocote Exact®**, controlled release fertilizers from Scotts. For full details about these superior fertilizers and for recommended rates of addition please refer to the Osmocote information section in the Scotts Fertilizer brochure.

Intercept 5GR - the revolutionary protectant insecticide giving up to 100 days control of aphids and whitefly, plus one years control of sciarid and vine weevil larvae from one dose. It is approved for use only with ornamental crops grown in containers. For full details please refer to the Scotts product information leaflet.

Terrazole 35WP - a fungicide for the control of *Pythium* and *Phytophthora* on a wide range of ornamentals and edible crops.

Aggregates such as sand or grit can be added to most composts as ballast or to improve handling. However, we do not recommend these additions to improve aeration.

Additional coarse peat to further enhance physical qualities and AFP if required.

Bark, coir, green waste and other raw materials can be added on request.

Other approved pesticides added only at specific request.

Increased lime addition to raise pH for crops such as lilies or bulbs.

Nutrient modifications to suit individual cropping requirements.
